

Database Schema — Pet Profiles

Companion Pet Module — PostgreSQL — PawGuard Platform

1. companion_pets (core table)

Column	Type	Notes
id	UUID, PK	
owner_id	UUID, FK → users.id	Indexed. Cascade delete with owner
name	varchar(255)	Required
species	varchar(64)	Default “dog”
breed	varchar(128)	Optional
sex	varchar(32)	Optional
birth_date	timestamptz	Optional
color	varchar(128)	Optional
microchip_id	varchar(64)	Unique + indexed, optional
emergency_notes	text	Shown on public safety-tag scan
is_scan_enabled	boolean	Default true — owner can disable public scan
created_at / updated_at	timestamptz	Standard timestamp mixin
deleted_at	timestamptz, nullable	Soft delete — null = active

How many pet profiles exist: this is a live, growing count — not a fixed number in the schema. Query it directly: `SELECT COUNT(*) FROM companion_pets WHERE deleted_at IS NULL;` Filter by status via `is_scan_enabled` or join to `pet_safety_tags` for tagged pets only.

2. Related Tables

Table	Key Columns	Purpose
vet_clinics	id, name, address, phone, is_active	Clinic directory
vet_clinic_memberships	clinic_id, user_id, membership_role	Links staff users to a clinic. Unique active membership per (clinic, user)
pet_clinic_access	pet_id, clinic_id	Grants a clinic visibility into a specific pet's records
medical_records	pet_id, clinic_id, authored_by_id, record_type, title, occurred_at	One row per medical event
pet_safety_tags	pet_id, token_hash, token_prefix, is_active, scan_count, last_scanned_at	QR tag — raw token never stored, only its hash. One active tag per pet
appointments	pet_id, clinic_id, status, scheduled_for	Status: requested/confirmed/cancelled/completed/no_show
pet_reminders	pet_id, kind (vaccination/medication)	Recurring reminder definitions
pet_reminder_deliveries	reminder_id, user_id, scheduled_for, delivered_at	One row per reminder actually sent — prevents duplicate delivery

3. Key Constraints

- `companion_pets.microchip_id`: unique across the table (when set)
- `pet_safety_tags`: partial unique index ensures only ONE active tag per pet at a time (old tags deactivated on rotation)
- `vet_clinic_memberships`: partial unique index prevents duplicate active memberships for the same (clinic, user) pair
- `pet_reminder_deliveries`: unique on (reminder_id, user_id, scheduled_for) — guarantees a reminder is never delivered twice for the same slot
- All FK columns are indexed for join performance (owner_id, pet_id, clinic_id, user_id, reminder_id)
