

Interactive Vet Directory

companion_pet module — vet_clinics

PawGuard Platform | pawguard-backend (FastAPI + PostgreSQL + Redis + ARQ) | Prepared for Team Review

1. Purpose

A searchable directory of veterinary clinics that pet owners can browse, filter (e.g. emergency-capable), and link their pet to — forming the access boundary that lets clinic staff see only the pets they're authorized to treat.

2. Data Model

Table	Key Columns	Purpose
vet_clinics	name, address, phone, email, services, latitude/longitude, is_emergency, is_active	Clinic directory listing, map-searchable
vet_clinic_memberships	clinic_id, user_id, membership_role (default “staff”), is_active	Links a platform user account to a specific clinic (one active membership per user/clinic pair)
pet_clinic_access	pet_id, clinic_id, granted_by_id, is_active	Grants a specific clinic visibility into a specific pet's record (one active grant per pet/clinic pair)

3. Endpoints

Method & Path	Permission	Purpose
GET /companion-pets/clinics	public read	List / search clinics (name, location, emergency flag)
POST /companion-pets/clinics	vet_clinic:manage	Register a new clinic (admin only)
PATCH /companion-pets/clinics/{clinic_id}	vet_clinic:manage	Edit clinic details
DELETE /companion-pets/clinics/{clinic_id}	vet_clinic:manage	Soft-delete a clinic
POST /companion-pets/clinics/{clinic_id}/memberships	vet_clinic:manage	Add a staff member / vet to a clinic

4. Two-Layer Access Model

A clinic seeing a pet's record requires two things to both be true — this is why a vet doesn't see every pet in the system by default:

- The staff member holds an active vet_clinic_memberships row for that clinic (platform role “veterinarian”).
- That clinic holds an active pet_clinic_access grant for the specific pet (granted by the owner or an admin).

5. Location-Based Search

vet_clinics carries the same latitude/longitude + Haversine-distance pattern used in Lost Pet Alerts (see GPS Location Pinning doc), enabling “nearest emergency clinic” style queries from the mobile app.
