

Appointment Booking Module

companion_pet module — pet_appointments

PawGuard Platform | pawguard-backend (FastAPI + PostgreSQL + Redis + ARQ) | Prepared for Team Review

1. Purpose

Lets a pet owner book, view, confirm, and cancel veterinary appointments at a linked clinic, with clinic staff able to manage the appointments on their side.

2. Data Model — pet_appointments

Column	Type	Notes
id	UUID (PK)	
pet_id	UUID (FK → companion_pets)	Which pet the appointment is for
owner_id	UUID (FK → users)	Booking owner
clinic_id	UUID (FK → vet_clinics)	Target clinic
vet_id	UUID (FK → users, nullable)	Assigned veterinarian, if known
status	ENUM	Appointment lifecycle state

Indexed on (pet_id, status) for fast “upcoming appointments for this pet” lookups.

3. Endpoints

Method & Path	Permission	Purpose
POST /companion-pets/appointments	appointment:create	Owner books a new appointment
GET /companion-pets/appointments	appointment:read	List appointments (scoped by role)
GET /companion-pets/appointments/{id}	appointment:read	Appointment detail
POST /companion-pets/appointments/{id}/cancel	appointment:cancel	Owner or clinic cancels
POST /companion-pets/appointments/{id}/confirm	appointment:manage	Clinic staff confirms the booking

4. Status Lifecycle

A booking can also be Cancelled from Requested or Confirmed. Only clinic staff holding appointment:manage can move a booking to Confirmed — owners can create and cancel, not self-confirm.

5. Access Rules (Permission Matrix)

Action	Owner	Vet Clinic	Admin
Book appointment	✓ (own pets)	✗	✓
View appointment	✓ (own)	✓ (own clinic)	✓ (all)
Cancel appointment	✓ (own)	✓ (own clinic)	✓ (all)
Confirm appointment	✗	✓ (own clinic)	✓ (all)
